

std::exception

```
classDiagram
    class std_exception["std::exception"]
    class CreateTextureError
    CreateTextureError --|> std_exception
```

The diagram illustrates an inheritance relationship. At the top is a class box for `std::exception`, which is divided into three horizontal sections: the top section contains the name, and the two bottom sections are empty. Below it is a class box for `CreateTextureError`, which is divided into three horizontal sections: the top section contains the name, the middle section is empty, and the bottom section contains a list of public methods. A blue arrow with an open triangular head points from the `CreateTextureError` box up to the `std::exception` box, indicating that `CreateTextureError` inherits from `std::exception`.

CreateTextureError

- + CreateTextureError()
- + ~CreateTextureError()
- + what()
